Student Name: Justin Norman A. Panado

Group: 8

Assigned Role: File Manager Developer

What did I contribute to the project? Work on creating, deleting, and managing files and folders.

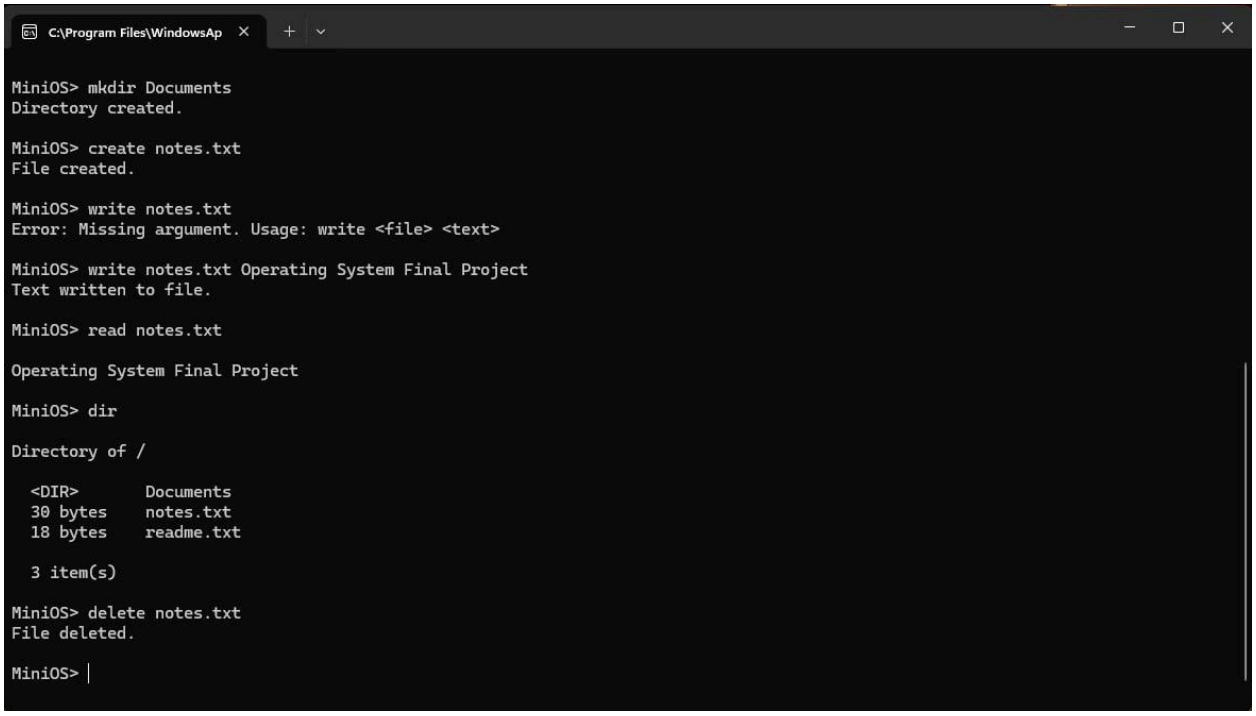

What features did I personally develop? I developed everything in the **filesystem.p**y like the path normalization, persistence, all file commands

What problems did I encounter? My first problem was handling file paths like **`cd ..`** and **`/docs/a.txt`.** I solved this by using **`_normalize()`** to organize paths and **`_node()`** to find files and folders. My second problem was that files disappeared when the program closed, so I saved them in **`minios_disk.json`** and loaded them when the program started. I also added a default **`readme.txt`** if no saved data existed. My third problem was preventing errors when managing files, so I added checks to avoid duplicate names, deleting folders with files inside, reading folders as files, and using invalid names. I used `FileSystemError` to show clear error messages when these problems happened.

How did I solve those problems? solved these problems by using **`_normalize()`** and **`_node()`** to handle file paths and find files and folders. I also used **`_parent_and_name()`** to identify the correct folder and file name. To keep files from disappearing, I saved the data in **`minios_disk.json`** and loaded it when the program started. I added a default **`readme.txt`** if no saved data existed. I added checks to prevent errors like duplicate names, deleting folders with files inside, and using invalid names. I used **`FileSystemError`** to show error messages and keep the program from crashing.

What did I learn from this project? I learned how a file system works and how to organize files and folders. I also learned how to save data, check for errors, and show clear error messages. Working with my group taught me how to make my code simple and easy to understand. If I could improve the project, I would fix problems with corrupted JSON files, saving data, showing file sizes, and keeping extra spaces in text.

Evidence of my contribution:

This is how we create a file.
