Individual Contribution Report

Operating Systems Final Project · MiniOS Ekoms

Student Name: Necesario

Group: Group 8 - SC1063 (MiniOS Ekoms)

Assigned Role: Project Leader and CLI Developer

What did I contribute to the project?

I was the project leader. I managed the group, created the GitHub repository, combined everyone's code into one program, and checked the final version. I also wrote the README. As the CLI developer, I built the command shell that connects all the other parts.

What features did I personally develop?

- The command prompt and the main shell loop in `main.py`.
- Command processing: reading what the user types and running the correct command.
- The commands `help`, `clear`, `date`, `time`, `echo`, `history`, `version`, and `exit`.
- The "Unknown command" message so the program does not crash.

What problems did I encounter?

- Uploading to GitHub put the files in the wrong folder and included cache files.
- GitHub would not accept empty folders.
- The window closed too fast, so the exit message could not be seen.

How did I solve those problems?

- I uploaded again from inside the project folder and added a `.gitignore` file.
- I created each folder by adding a file with the folder name in its path, like `docs/README.md`.
- I added a pause at the end of `main.py` and ran the program from CMD.

What did I learn from this project?

I learned how the shell connects the user to the files, processes, memory, and users of an operating system. I also learned why error handling is important, and how to lead a team and combine our work using GitHub.

Evidence of my contribution:

GitHub repository: https://github.com/OtitsDub/Group8-SC1063

Source code: Main.py

Documentation: README.md
